

Abstract

[0031] A food cutting device includes a body having two longitudinal edges and a blade configured such that its cutting edge is a predetermined distance from a removable plate inserted therein. The device preferably includes a food holder having a guide configured to slideably connect to at least one of said longitudinal edges of the body to bring a food item safely in contact with the blade. A storage caddy, which may be used in conjunction with the food cutting device, includes a housing and a pair of housing guides configured to slideably connect to the body, wherein the storage caddy includes a number of partitions or chambers to accept unused plates. At least one of the plates may include a protector designed to at least partially conceal the blade on the underside of the body.
